the algorithm
you want to
implement

Inspiration

Dirac-Chebyshev Degulsion with Tripolsive Tail Canceling and other shit that's over your head

In this model, when the probability density of two series as a tripulsive function which is zero on the positive integer.

$$y = \beta(0) + \beta(1)x + \beta(2)x^2 + \alpha \sum_{n=0}^{\infty} f^n[m] g[m + n] (f \star g)(n)$$

For each unit increased from x to $x + 1$ units, the expected yield changes by

$$\prod_{i=1}^n d^2 \sigma_{\mu\nu} \ell_{\mu}^{\nu} \mu_{\mu\nu}(x, M_{\mu\nu}^2(E_{\mu})) \rightarrow (\hat{M}(x := E_{\mu})) \times \ln \Gamma(x_0)$$

Where ℓ_{μ}^{ν} is given by:

$$\mathbf{N} \pm \ell_{\mu}^{\nu 1/2} \nabla b_{\mu}^{\nu} \nabla^2 (dx, A) f \equiv \int_{\mathcal{A}} s_1 - g^*(\nabla x_2) ds$$

It can then be solved using:

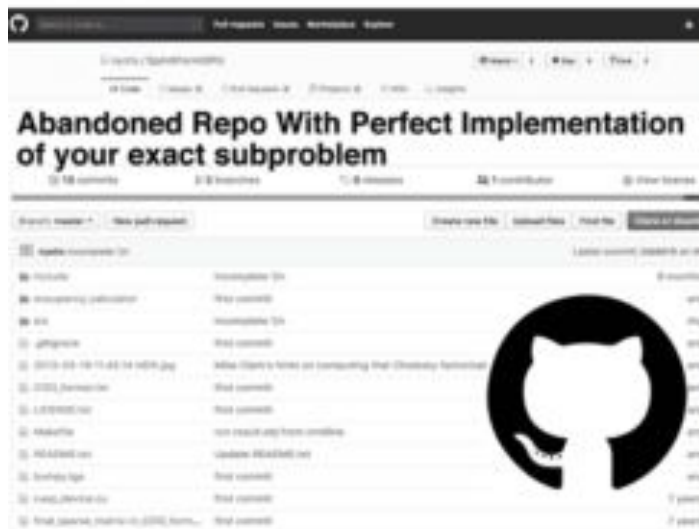

$$\begin{bmatrix} \Gamma_1^1 & \Gamma_1^2 & \Gamma_1^3 & \dots & \Gamma_1^m \\ \Gamma_2^1 & \Gamma_2^2 & \Gamma_2^3 & \dots & \Gamma_2^m \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ \Gamma_{2n}^1 & \Gamma_{2n}^2 & \Gamma_{2n}^3 & \dots & \Gamma_{2n}^m \end{bmatrix} \approx \begin{bmatrix} x_1^1 - \lambda & x_1^2 - \lambda & x_1^3 & \dots & x_1^m \\ x_2^1 & x_2^2 & x_2^3 & \dots & x_2^m \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ x_n^1 & x_n^2 & x_n^3 & \dots & x_n^m - \lambda \end{bmatrix}$$

Which yields the degulsion curve of:

$$\sum \beta_2 \alpha(x) \theta(r)$$

Inspiration

Inspiration

The most used **tools are easy to use and easy to access.**

- AlexNet
- ConvNeXt
- DenseNet
- EfficientNet
- EfficientNetV2
- GoogLeNet
- Inception V3
- MaxVit
- MNASNet
- MobileNet V2
- MobileNet V3
- RegNet
- ResNet ←
- ResNeXt
- ShuffleNet V2
- SqueezeNet
- SwinTransformer
- VGG ←
- VisionTransformer
- Wide ResNet

There are lots of researchers using older architectures instead of newer ones just because there are plenty of implementations on the internet.

Inspiration

Even though you may find a paper excellent, you may not choose to use it just because the barriers preventing you from using it. Some of these barriers could be:

- No codebase
- Codebase, executes on your machine, dependencies failed —→ Environment not specified
- “We use 80% to train and 20% for test” —→ Dataset splits are not specified

Inspiration

Even though you may find a paper excellent, you may not choose to use it just because the barriers preventing you from using it. Some of these barriers could be:

- No codebase
- Codebase, executes on your machine, dependencies failed ———> Environment not specified
- “We use 80% to train and 20% for test” ———> Dataset splits are not specified

And it's fine to not put everything on the paper, at the end, a scientific paper purpose is to present novel ideas. Nevertheless, nowadays exist many tools to record all the little details that go into creating your work.

Inspiration

Also, having things organized and being able to reproduce your results is cool

- Someone asks for your code? Share your github repo with clear instructions.
- Want to test your method on other datasets? Fine, create a dataloader and run the experiment.
- Your model weights were magically deleted? No problem, run the experiment again with the same configuration.

Good practices for experiment reproducibility

Examples

- ConvNeXt

Results and Pre-trained Models

ImageNet-1K trained models

name	resolution	acc@1	#params	FLOPs	model
ConvNeXt-T	224x224	82.1	28M	4.5G	model
ConvNeXt-S	224x224	83.1	50M	8.7G	model
ConvNeXt-B	224x224	83.8	89M	15.4G	model
ConvNeXt-B	384x384	85.1	89M	45.0G	model
ConvNeXt-L	224x224	84.3	198M	34.4G	model
ConvNeXt-L	384x384	85.5	198M	101.0G	model

Examples

- ConvNeXt

Installation

We provide installation instructions for ImageNet classification experiments here.

Dependency Setup

Create an new conda virtual environment

```
conda create -n convnext python=3.8 -y
conda activate convnext
```

Install [Pytorch](#)>=1.8.0, [torchvision](#)>=0.9.0 following official instructions. For example:

```
pip install torch==1.8.0+cu111 torchvision==0.9.0+cu111 -f https://download.pytorch.org/whl/torch_stable.html
```

Clone this repo and install required packages:

```
git clone https://github.com/facebookresearch/ConvNeXt
pip install timm==0.3.2 tensorboardX six
```

Examples

- ConvNeXt
- Vision Transformer

Installation

Make sure you have `Python>=3.6` installed on your machine.

Install JAX and python dependencies by running:

```
# If using GPU:
pip install -r vit_jax/requirements.txt

# If using TPU:
pip install -r vit_jax/requirements-tpu.txt
```

Examples

- ConvNeXt
- Vision Transformer

Fine-tuning a model

You can run fine-tuning of the downloaded model on your dataset of interest. All models share the same command line interface.

For example for fine-tuning a ViT-B/16 (pre-trained on imagenet21k) on CIFAR10 (note how we specify `b16,cifar10` as arguments to the config, and how we instruct the code to access the models directly from a GCS bucket instead of first downloading them into the local directory):

```
python -m vit_jax.main --workdir=/tmp/vit-$(date +%s) \  
  --config=$(pwd)/vit_jax/configs/vit.py:b16,cifar10 \  
  --config.pretrained_dir='gs://vit_models/imagenet21k'
```
